

CUSTOMER 365

Scrum meeting 1 Documentation

- Data Flow Diagram

Microsoft Graph (External Entity): Pushes real-time payloads to your system whenever an employee sends an email or Teams message.

Webhook Listener (Process 1): Your Node.js server securely receives the incoming payload and extracts the sender, recipient, and message body.

Domain Filter (Process 2): The system cross-references the email domains against your database to ensure internal chatter is dropped and only client-facing communications proceed.

AI Analysis Module (Process 3): The core intelligence engine where raw text is sent to the AI to derive sentiment and detect early risk signals.

Firestore Database (Data Store): The structured interaction is logged against the specific contact and account.

Health Score Engine (Process 4): A background process recalculates the account's overall health score based on the new interaction's sentiment and risk data.

React Dashboards (Output): The client data surfaces automatically on the Activity Timeline and updates the Executive Health Dashboards without any manual data entry.

- **Tech Stack**

Frontend: **React**

Backend: **Node.js**

Database: **Firebase**

- **Work Flow**

Trigger: The workflow begins the moment a client or employee sends a message via Microsoft 365.

Ingestion: The Microsoft Graph API instantly pushes that event payload to your Node.js backend.

Filtering: The server filters out internal chatter by checking the email domains against the stored accounts.

AI Analysis: Valid client interactions are sent to the Gemini API to extract sentiment and flag relationship risks.

Storage: The Node.js server writes the AI's JSON output directly to Firestore and updates the account's health metrics.

Real-Time Render: Because Firestore supports real-time listeners, the React frontend instantly detects the new database entry. It updates the Activity Timeline and triggers an infinite-scrolling marquee effect across the UI to immediately broadcast any critical risk signals to the dashboard viewers without requiring a page refresh.
